AutoCAD LT includes new features including the ability to read DWG files of 2008 drawings. Although this version is free, the company also provides licensing for AutoCAD and AutoCAD LT at a cost of \$700 per person per year. AutoCAD is also available in the form of a distributable license: AutoCAD LT is distributed in the form of a distributable license, through a pre-installed software package. Subscription and professional version In addition to these free versions, Autodesk provides a subscription version of AutoCAD and AutoCAD LT, as well as an AutoCAD 360 Suite. In 2013, Autodesk rebranded its products as Autodesk Inventor, Autodesk Revit, Autodesk Navisworks, Autodesk BIM 360, Autodesk Project Services, Autodesk uDesign and Autodesk Navis. The core functionality of AutoCAD, in particular, is preserved but the product has been rebranded to make it more similar to other Autodesk software, including Inventor, Revit, and others. Subscriptions can be purchased in one-, three-, five-, ten- or fifteen-year cycles, and offer more services and functionality than the free versions. There is also an AutoCAD subscription called AutoCAD Architecture that includes both Autodesk Project Services and Navisworks. This allows CAD consultants and AutoCAD designers to combine architectural design with real-time documentation and collaboration. This version is best suited for architectural designers who want to draw and model full-time. Architects can use AutoCAD Architecture to create working drawings, both complete CAD drawings and construction documents. On August 25, 2012, Autodesk released AutoCAD 2011 which was the first product of the subscription line called AutoCAD Architecture. The new release adds the ability to work with building information modeling (BIM). The updates include an updated Project Center and Application Center, as well as a new Interoperability Center, which allows the use of industry-standard DWG, DGN, DXF, DGN, IFC, Revit Architect a1d647c40b

Q: How to set Django 2.0 settings for different environments When you install Django on different environments, you use settings_local.py for local dev, settings.py for staging, and settings_prod.py for production. These files all have their own pythonpath (the environment/Django project directories) that corresponds to their own project(s). How can I set these paths to work with my project? I know I can put an "import os" at the top of the settings.py, but then that imports all of the settings and if I want to set different paths per environment, then I will have to update it every time I switch environments. Is there a better way? A: This is better than importing os, which is needed anyway, otherwise you can't import configurable modules such as django.core.management. import os.path os.environ["DJANGO_SETTINGS_MODULE"] = "project.settings_prod" os.environ["DJANGO_PROJECT_SETTINGS_MODULE"] = "project.settings_prod" You could also create a custom setting in your settings.py file and use it to set the settings.PYTHONPATH. This way you can set it up once for all environments. import os os.environ["DJANGO_SETTINGS_MODULE"] = "project.settings" os.environ["DJANGO_PROJECT_SETTINGS_MODULE"] = "project.settings" Then import os.path as usual: import os import os.path #...
